H.M. Pitt Labs, Inc. performed an Asbestos Containing Materials and Lead-Based Paint Survey for the purpose of the planned renovation of a building located at 50 North 4 St. Chula Vista Ca. 91910 on November 9, 2021. The survey for asbestos containing materials and lead base and lead containing paint was conducted by AHERA Building Inspector Richard Meyers ABIR15210004N29017, CPDH # LRC-00005584, working under the direct supervision of, Leland Pitt Certified Industry Hygienist# 4303 and Ken Trump CA DPH Certified Lead Inspector/Assessor #LRC 00002048.

The results and findings that are contained herein are representative of conditions that were present on November 9, 2021 Any conditions that have changed since these dates are not represented nor contained in this report.

#### **Conclusions**

This Asbestos Containing Material (ACM) Survey did detect asbestos in the 9x9 and 12x12 floor tiles, Black Mastic, Sprayed on Acoustical Ceiling, Roof Penetration Mastic

This lead survey detected Lead Based Paint (LBP) was detected on the white exterior window frames. Lead-containing paint (LCP) was detected in the white exterior stucco walls and exterior block walls

For public and residential projects, LBP/LCP will require abatement by CA DPH Certified Lead trained supervisors and workers. For all other projects, LBP/LCP will require abatement by workers trained in the Cal OSHA Lead in Construction Standard (Title 8 CCR 1532.1) or the Fed OSHA Standard (29 CFR 1926.62). These materials are presented in the appropriate appendices. The amounts of materials are approximate and must be verified by the building owner and abatement contractor.

Positive materials are presented in the appropriate appendices. The amounts of materials are approximate and must be verified by the building owner and abatement contractor. H. M. Pitt Labs, Inc. assumes no liability for any discrepancies in the amounts listed for any materials.

#### Recommendations

Any materials that have been determined to contain asbestos or lead paint that will be affected by renovation, remodeling and/or renovation activities, must be isolated and/or abated by a licensed abatement contractor.

Materials that are determined to contain asbestos or lead paint that are damaged must be abated/stabilized prior to renovation.

Materials that have been determined to contain lead-based paint that are determined to be "intact" by a California DPH Inspector/Assessor may be demolished in place and disposed of as construction debris once properly profiled for waste determination.

Materials found to contain <1% asbestos can be assumed to contain greater than 0.1% asbestos, or additional analysis using Transmission Electron Microscopy (TEM), or Point Counting Methodology or Gravimetric reduction may be used for a more definitive analysis of these materials. Materials found to contain >0.1% - 1% asbestos can be treated as construction waste; however, workers would still be required to comply with OSHA worker protection regulations (Title 8 CCR 1529, and 29 CFR 1926.1101).

Asbestos containing materials may be submitted to an accredited laboratory for Gravimetric Point Count analysis as a more definitive means of quantifying asbestos content for the purposes of renovation. This is in accordance with conversations with the United States Environmental Protection Agency Region IX office. This method of analysis is more definitive than PLM or Point Counting and may greatly reduce the amount of asbestos containing material waste that is generated.

All construction work where an employee may be occupationally exposed to lead in any amount must comply with OSHA standards Title 8 CCR 1532.1, and 29 CFR 1926.62.

Lead-Based Paints (LBP) are identified by State and Federal Standards as paint or other surface coatings that contain an amount of lead equal to or in excess of one milligram per square centimeter (1mg/cm2) or one half of one percent (0.5%) by weight or 5000 mg/kg.

Lead-Containing Paints (LCP) are identified by the Cal OSHA Lead in Construction Standard as lead greater than or equal to 600 ppm or 600 mg/kg. LCP has been identified as a potential hazard to workers during paint disturbance activities.

The City of San Diego's Renovation and Remodeling rule, Section 54.1005-1006, requires that renovators are required to use lead-safe work practices when disturbing lead paint that contains lead concentrations equal or greater than 1000 ppm or  $0.5 \text{ mg/cm}^2$  on all pre-1979 buildings and structures.

Prior to any activities that may affect suspect materials found during the renovation that were unable to be sampled during these surveys, that additional sampling must be conducted to determine the content of suspect materials found at the subject sites.

This executive summary does not contain all the information that is contained in the full report. The report should be read in its entirety to obtain a more complete understanding of the information provided and to aid in any decisions made or actions taken based on this information.

#### Purpose

The Asbestos and Lead-Based Paint Survey was performed to locate the presence of building materials commonly known to potentially contain asbestos or lead paint. Suspect and/or confirmed Asbestos Containing Material (ACM) and Lead-Based Paint (LBP) discussed below are assumed to be present on similar components within the structure.

The survey consisted of noting materials that are commonly known to potentially contain asbestos or lead paint. Materials sampled during the Asbestos and Lead-Based Paint Survey included friable and non-friable suspect asbestos containing materials and suspect lead-based painted components.

Friable asbestos containing materials are materials that can be crushed or pulverized by hand pressure when dry, or materials that can be rendered to a crumbled, pulverized, or powdered state when dry, by crushing, abrading, sanding, sawing, shot blasting, scarifying, or through renovation or renovation activities using mechanical means/methods.

The Environmental Protection Agency (EPA) National Emission Standards for Hazardous Air Pollutants (NESHAP) requires an inspection for asbestos be performed on facilities which are to undergo renovation or renovation work. Material found to contain asbestos may need to be removed prior to the start of such renovation/renovation work.

This Lead-Based Paint Survey was designed to comply with California Department of Public Health (CDPH) and Department of Housing and Urban Development (HUD) protocols for lead-based paint in public or residential buildings by confirmative sampling. It was designed to assess the presence of lead-based painted components that may be affected by the planned renovation of 50 North 4 St. Chula Vista Ca. 91910. The Lead-Based Paint Survey was performed by accredited California Department of Public Health Lead Sampling Technicians working under the direction of CDPH Certified Lead Inspector/Assessor. Paint chip samples collected were analyzed via Total Threshold Limit Concentration (TTLC) by an American Industrial Hygiene Association (AIHA) Environmental Lead Laboratory Accreditation Program (ELLAP) accredited laboratory.

The Asbestos Containing Materials Survey was performed by CA DOSH Certified Asbestos Building Inspectors trained under the guidelines of the Asbestos Hazard Emergency Response Act (AHERA) and under the supervision of a California Certified Asbestos Consultant. The collected samples were analyzed by Polarized Light Microscopy (PLM) by a National Voluntary Laboratory Accreditation Program (NVLAP) accredited laboratory.

### Asbestos and Lead-Based Paint Survey

The project consists of a survey for lead and asbestos associated with the property located at 50 North 4 St. Chula Vista Ca. 91910. The building that is being renovated has 6 rooms, lobby, 2 bathrooms, kitchen, janitor room and the roof.

Materials that could not be sampled and are assumed ACM include any in-wall materials that may be encountered during renovation phase and any unidentified piping in the underground of the existing building pads. Additional materials may also exist under the carpeting, in wall cavities, or other inaccessible areas. Should additional suspect materials be observed during renovation/renovation activities, those materials must be analyzed for asbestos?

The building was also surveyed for lead containing building components. The survey was conducted using a modified HUD, EPA, and California DPH sampling strategy for the purpose of renovation. Representative samples of suspect building components were collected and analyzed for lead.

The objective of this Asbestos Containing Material and Lead-Based Paint Survey was to identify materials for sampling and analysis to determine the presence or absence of asbestos containing materials (ACM) or lead containing building components that will be disturbed in the planned renovation of the above referenced property. The following services were provided for the survey:

- 1. Review of information provided by the client and/or Owner regarding the dates of construction, materials used in construction, as well as location of suspect materials in the portable buildings.
- 2. Visual location of building materials which are commonly known to potentially contain asbestos or lead paint or coating;
- 3. Collection of building material samples identified as suspect ACM;
- 4. Collection of samples of building components identified as suspect lead-based paint or coating
- 5. Preparation of this report that relates the findings of the ACM and LBP Surveys and also presents H.M. Pitt Labs, Inc.'s conclusions and recommendations.

Third Party Reliance

Third party reliance letters may be issued upon request and upon the payment of the, then current fee for such letters. All third parties relying on H.M. Pitt Labs, Inc.'s reports, by such reliance, agreed to be bound by H.M. Pitt Labs, Inc.'s General Terms and Conditions and limitations. No reliance by any party is permitted without such agreement, regardless of content of the reliance letter itself.

# Methodology

### Visual Inspection

An initial walkthrough of the structure was conducted to determine the presence of suspect materials in the areas that will be disturbed during the proposed renovation. Materials that were found in areas of similar ages, as well as similar in color and general appearance were grouped into homogenous sampling areas. Also identified were areas and/or building components that were coated with suspect lead-based paint or surface coatings. Original "as built" drawings were not made available for the survey.

#### Sample Procedures

Selected samples were collected from materials identified as suspect Asbestos Containing Material or Lead-Based Paint and selected surfaces were analyzed by bulk sampling the material. When sampling for asbestos containing materials, materials were misted with an amended water solution to keep the materials moist during the sampling efforts. Sampled suspect asbestos containing materials were plotted on a floor plan, placed in sealable industrial strength polyethylene bags, given a unique identifier number which was placed on the bag and then on the chain of custody sheet. Samples were then transported to H.M. Pitt Labs, Inc., a NVLAP, ELAP and ELLAP accredited laboratory.

#### Laboratory Methods of Analysis

The suspect asbestos containing material bulk samples were analyzed by Polarized Light Microscopy (PLM) with dispersion staining in accordance with EPA Interim Method (40 CFR 763, subpart F, Appendix A) for the determination of asbestos in bulk samples. This is a standard method of analysis in optical mineralogy and the currently accepted method for the determination of asbestos in bulk samples. A suspect material is immersed in a solution of known refractive index and subjected to illumination by polarized light. The characteristic color displays which enable mineral identification. It should be noted that some ACM's might not be accurately identified and/or quantified by PLM. As an example, the original fabrication of vinyl floor tiles routinely involved milling of asbestos fibers to extremely small sizes. As a result, these fibers may go undetected under the standard polarized light microscopy method. Transmission Electron Microscopy (TEM), Point Counting or Gravimetric Analysis may be necessary for a more definitive analysis of these materials. The suspect lead-based paint samples were analyzed by Flame Atomic Absorption (FAA) in accordance with EPA Method 3050-M, 7420-M for the determination of lead. Samples were analyzed by H.M. Pitt Labs, Inc. which is an ELLAP/ELAP Accredited laboratory for the analysis of lead.

## Laboratory Quality Control Program

H.M. Pitt Labs, Inc. is a licensed laboratory which maintains an in-house quality control program, NVLAP accreditation, an Environmental Laboratory Accreditation Program (ELAP) accreditation, and an Environmental Lead Laboratory Accreditation Program (ELLAP) accreditation. These programs involve blind reanalysis of ten percent of all samples, precision and accuracy controls, and use of standard bulk reference materials.

# Conclusions

### General Summary

This building 50 North 4 St. Chula Vista Ca. 91910. It is unknown if and when these buildings have had any renovation since it has been built. There was no attic or crawl space.

This Asbestos Containing Material (ACM) Survey did detect asbestos in the 9x9 and 12x12 floor tiles, Black Mastic, Sprayed on Acoustical Ceiling, Roof Penetration Mastic. A material is considered to be an asbestos containing material (ACM) if at least one sample collected from the area shows asbestos present in an amount greater than one percent (>1%) by weight.

Lead Based Paint (LBP) was detected on the white exterior window frame on building. Lead-containing paint (LCP) was detected in the white exterior stucco walls and exterior block walls

Lead-based paint (as defined by the California Department of Public Health, Title 17) means paint or other surface coatings that contain an amount of lead equal to, or in excess of one milligram per square centimeter ( $1.0 \text{ mg/cm}^2$ ), one-half of one percent by weight (0.5%) or 5000 mg/kg.

Lead-Containing paints are regulated by Federal, State and Local agencies. California Occupational Safety and Health Administration (CAL/OSHA) under worker protection guidelines requires all construction work where an employee may be occupationally exposed to lead in any amount must comply with the Lead in Construction Safety Order, Title 8 CCR Section 1532.1.

Analytical Results Tables

This Asbestos and Lead-Based Paint Survey did detect asbestos. Lead-based and lead containing paints/materials/building components were detected.

Positive results of the Asbestos Containing Materials (>1.0%), Asbestos Containing Construction Materials (0.1%-1%) and Lead-Based Paints (1.0 mg/cm<sup>2</sup>, 0.5% wt., or 5,000 mg/kg) or Lead-Containing paints (0.06% or 600 mg/kg) are presented in the table below.

The quantities of each material are approximations only. It is the responsibility of the potential bidders for the project to verify and confirm actual quantities in the field. Please refer to the appropriate Appendix for a more detailed description of the microscopic analysis of these samples.

Sample		Sample Description	% & Type of Asbestos	Friability	Approx. Amount
	Rooms 1,2,5	Sprayed on Acoustical Ceiling	<1% Chrysotile	Friable	800sf
38,39	Air Handler, Chimney	Black Roof Penetration	7&8% chrysotile	Non Friable	10 lf
41-46	Janitor Room	Red 9x9 Floor Tile, Black Mastic	3 to 9% chrysotile		10sf
	Main Room, Room 2 under Gray Carpet	12x12 Floor Tile Black Mastic	5to 7 % chrysotile	Non Friable	1200sf
59,60,61	Lobby, Room 5 under Blue Carpet	12x12 Floor Tile Black Mastic	7to 9 % chrysotile	Non Friable	900sf

## Asbestos Containing Materials (>1%)

## Asbestos Containing Construction Materials (>0.1% wt.)

No asbestos was detected	Type of Asbestos	 Amount

All samples were analyzed by EMSL Analytical San Diego. Please see the end of the typed data for their current NVLAP and ELAP certification number.

# Lead-Based Paints 5000 mg/kg, 1.0 mg/cm2, 0.5% wt. and above

Sample	Sample Location	Sample Description	mg/kg lead	Condition	Approx. Amount
10	Exterior Window Frames	White Paint	10000 mg/kg	Intact	350sf

Sample	Sample Location	Sample Description	mg/kg lead	Condition	Approx. Amount
09	Interior Window Frames Front Lobby	White Paint on Window Frames	2870mg/kg	Intact	125sf
11 14	Exterior Stucco Wall Exterior Stucco Wall on Roof	White Paint on Stucco Wall White Paint on Stucco Wall	1950 mg/kg 2450 mg/kg	Intact Intact	1500sf 420sf

## Lead-Containing Paints ≥0.06% wt. (600 mg/kg)

# Recommendations

Prior to any activities that may affect suspect materials found during construction work that were not sampled during this Asbestos and Lead-Based Paint Survey, additional sampling must be conducted to determine the content of the suspect materials found at the subject sites.

## <u>Asbestos</u>

Any material that has been determined to contain asbestos at the site that will be affected by renovation must be abated by AHERA Certified Asbestos Contractor/Supervisor and/or AHERA Certified Asbestos Worker personnel. The contractor must be registered with CAL/DOSH as an asbestos contractor and the California State Contractors Licensing Board (CSLB) as an asbestos abatement contractor.

All Asbestos Containing Materials (>1%) must be characterized for disposal in accordance with Federal, State and Local requirements. All Asbestos Containing Construction Materials (ACCM) (>0.1% wt. &  $\leq 1.0$  % wt.) can be disposed of as regular construction debris after being removed as ACM. The owner is responsible for obtaining disposal waste characterization requirements for the project.

## Lead

Lead-Based Paints or other surface coatings that contain an amount of lead equal to or greater than one milligram per square centimeter  $(1.0 \text{ mg/cm}^2)$ , or one half of one percent (0.5% wt) or 5000 mg/kg must be rendered intact or removed by properly trained and certified personnel. Lead containing waste must be profiled for proper disposal.

Lead-Containing Paints (LCP) are identified by the Cal OSHA Lead in Construction Standard as lead greater than or equal to 600 ppm or 600 mg/kg. LCP has been identified as a potential hazard to workers during paint disturbance activities.

50 North 4st Chula vista CA. 91910 In the event that buildings materials found to contain hazardous amounts of lead are to be disturbed, it is required that those materials be abated or stabilized by lead trained workers prior to renovation or renovation.

The City of San Diego's Renovation and Remodeling rule, Section 54.1005-1006, require that renovators are required to use lead-safe work practices when disturbing lead paint that contains lead concentrations equal or greater than 1000 ppm or  $0.5 \text{ mg/cm}^2$  on all pre-1979 buildings and structures.

Any component identified as containing lead-based paint or lead-containing paint must be stabilized prior to renovation and characterized for waste disposal. Materials must be stabilized by personnel trained in lead abatement. All construction work where an employee may be occupationally exposed to lead in any amount must comply with Title 8 CCR Section 1532.1. Lead containing waste must be profiled for proper disposal.

# Limitations

## Special Terms and Conditions

H.M. Pitt Labs, Inc. conducted an Asbestos Containing Material and Lead-Based Paint Survey in general accordance to a written contract with City of Chula Vista, located at 1800 Maxwell Rd. Chula Vista CA. 91910. This survey does not include sampling of soil, water, underground materials and/or components, or any debris at any of the sites for environmental testing. This report is intended for the use of La Mesa Spring Valley School District and its immediate assignees. The contents should not be relied upon by any party other than the aforementioned without the express written consent of H.M. Pitt Labs, Inc.

### Limitations and Exceptions of Assessment

The findings, conclusions and recommendations made in this report are based on the information that was made available to H.M. Pitt Labs, Inc., from City of Chula Vista; the information is relevant to the dates of our site work and should not be relied upon to represent conditions at any later date. The opinions and conclusions expressed herein are based on the information obtained during our assessment and on our experience and current standards of technical practice. H.M. Pitt Labs, Inc. makes no other warranties, either express or implied, concerning the completeness of the date furnished to us. H.M. Pitt Labs, Inc. cannot be responsible for conditions or consequences arising from relevant facts that were concealed, withheld, or not fully disclosed at the time of our assessment was undertaken. H.M. Pitt Labs, Inc. is neither responsible nor liable for work, testing or recommendations performed or provided by others. This Asbestos Containing Materials and Lead-Based Paint Survey is not and should not be construed as a warranty or guarantee about the presence or absence of environmental hazards or contaminants that

may affect the subject sites. Facts, conditions, and acceptable risk factors change with time; accordingly, this report should be viewed within this context.

EMSL maintains liability limited to cost of analysis. Interpretation and use of test results are the responsibility of the client. This report relates only to the samples reported above, and may not be reproduced, except in full, without written approval by EMSL. EMSL bears no responsibility for sample collection activities or analytical method limitations. The report reflects the samples as received. Results are generated from the field sampling data (sampling volumes and areas, locations, etc.) provided by the client on the Chain of Custody. Samples are within quality control criteria and met method specifications unless otherwise noted. The above analyses were performed in general compliance with Appendix E to Subpart E of 40 CFR (previously EPA 600/M4-82-020 "Interim Method") but augmented with procedures outlined in the 1993 ("final") version of the method. This report matrix and therefore EMSL recommends gravimetic reduction, approval, or endorsement by NVLAP, NIST or any agency of the federal government. Non-friable organically bound materials present a problem matrix and therefore EMSL recommends gravimetic reduction prior to analysis. Unless requested by the client, building materials manufactured with multiple layers (i.e. linoleum, wallboard, etc.) are reported as a single sample. Estimation of uncertainty is available on request.
